

DC++ : Using DC++ : How are automatic searches matched?

Question:

Answer:

Basically, the same algorithm as "search for alternates" is used. All strange characters from the filename are removed (.-_ and so on), and the search is sent. Then, any result returned that has exactly the same size is added as a source. All in all, it's not an exact filename match but the filename still plays a central role (otherwise, for instance, rar sets would be added to the wrong rars...)
