

**DC++ : Using DC++ : How can I configure DC++ to use it with proxy?**

**Question:**

**Answer:**

Currently, proxy connections are only supported in DC++ for downloading the public hub lists. To use a HTTP proxy for this, enter the full proxy address (<http://my.proxy.com:8080>) in the settings, under "HTTP Proxy".

In other words, connecting to a hub through a proxy is not supported.

Using a proxy to tunnel all DC++ traffic through it beyond the scope of this FAQ. While using a proxy can be helpful to help mask your real IP, it can also be abused for the very same reason, which is why it will not be covered.
