DC++ : Using DC++ : How do I protect myself from search spam in DC++?

Question:

Answer: By doing nothing! DC++ automatically does basic search spam protection for you. Keep in mind, that sometimes, when DC++ detects a search spam, it might be because the hub is overloaded and sends searches in big lumps, making the flood trigger react as too many searches arrive at once. If more than 5 searches are received from the same user within 7 seconds, DC++ will send out this warning.
